

FastFit Manifold

The ENKi FastFit Manifold is a strong, versatile and easy to use system for irrigation installers. The large selection allows for an endless number of configurations.

How it works

ENKi FastFit Manifold Fittings are assembled by inserting the coupling between two fittings, pressing the fitting together and sliding the locking clips over the lugs. Each join requires two clips and a coupling, except the inlet and the end cap which have built-in coupling.

Benefits

- Fast to install with just one push clip
- Can be pressurised immediately without tools or glue
- Unique O ring design prevents overtightening – and eliminates leaks
- Union fittings allow for easy removal or addition of valves without disassembling the manifold
- UV resistant and durable, made from virgin engineered plastics

Technical Information

- Maximum operating pressure 1400kPA
- Tested to 1600kPA
- UV resistant
